

# SMART SHOPPING ASSISTANT

**Paun David Andrei**

## Project specifications

### Project Overview

The purpose of this project is the implementation of an autonomous “Agentic commerce” platform, where users can make product requests (text and/or image), after which an AI agent autonomously searches through various online stores, calculates the best value and executes the final checkout process using a Bring Your Own Card approach.

### Key features:

- Text and Image recognition: the AI agent must be able to recognize both text and images and interpret them
- Value scoring: the app always chooses the best product by calculating a value score from 1 to 100 depending on:
  - Cost efficiency: based on the base price, shipping cost and market delta
  - Product quality confidence: based on average rating and review volume
  - Logistics and convenience: delivery time and in-stock status
  - Trust and risk mitigation: Check if the product is sold directly by the provider or a 3<sup>rd</sup> party
- Agentic search: Uses Tavily API to find products across the web without being blocked and Jina to retrieve the content of the opened tab and turn it into a Markdown file
- Automated checkout: The user has to choose between the 3 best options, then after he chooses an option, the app automates the checkout process; the user introduces the ephemeral card details and enters the passkey for advanced security.
- BYOC Approach: The app does not touch any user’s money, instead, it uses the credit card info only when needed.

### How it works:

- Whenever an user creates an account, he has to introduce his phone number, email address and shipping address, verify the email and phone number, set up a passkey, and choose between a free plan and a pro plan, then he is redirected to the standard conversation screen.
- User types the request and optionally adds some pictures
- Gemini processes the user input

- It sends the request to Tavily to identify the highest quality products
- Jina converts the content of the web pages into readable Markdown files
- Gemini applies the value scoring function on all the products and displays the top 3 recommendations to the user
- The user selects one of the 3 items
- If the user has checkouts left on the free plan or if he has the pro plan, he executes the next steps, otherwise, he is asked to enter the card details himself on the website.
- User introduces card details for a single purchase
  - User verifies himself by providing a passkey
  - Stagehand autocompletes with the requested payment details (card details, shipping address, etc.)
- If checkout is successful, data about the user's card is deleted from RAM, and otherwise, the user is shown the other best products in case of an out of stock situation and he has to re-enter the card details for safety, or in case of a captcha failure, it is provided a link to the respective website to manage the payment process by himself

## Programming languages and API's:

- **Frontend**
  - Next.js, TypeScript, Tailwind CSS, Lucide React
- **Backend**
  - Python 3.12+
  - FastAPI
  - Pydantic (for data validation)
- **Databases**
  - Supabase (PostgreSQL)
  - SQL
  - Supabase Auth (for user login)
- **API's**
  - LemonSqueezy API
  - Tavily API - provides AI-optimized web results
  - Jina Reader API – Converts website URL's into clean Markdown
- **AI tools**
  - Gemini 1.5 Flash – the core LLM for request recognition, image processing and value scoring
  - Stagehand – automates only the checkout part of the process
  - Model Context Protocol (MCP)
- **Deployment**
  - Vercel for frontend
  - Railway for backend
  - Supabase

## Financial Projections (Estimated Operating Costs)

### MVP Phase (0 to ~100 Users)

- **Fixed Infrastructure:** ~\$5.00 / month (Vercel Free, Supabase Free, Railway Developer Plan).
- **Variable API Cost:** ~\$0.075 USD (~0.35 RON) per successful agentic checkout.

## **Large Scale Phase (1,000+ Active Users)**

- **Fixed Infrastructure:** ~\$70.00 / month (Vercel Pro, Supabase Pro, Railway Scaled RAM).
- **Variable API Cost:** ~\$0.075 USD (~0.35 RON) per successful agentic checkout.
